

Exercise Class 1 – Requirements & UI

Establish Requirements

FH University of Applied Sciences TECHNIKUM WIEN

Class Exercise Version 1

- Your Customer wants you to develop an application
  - In general, this description is vague and incomplete

"Wir brauchen eine App für unseren kleinen Fahrradverleih. Kunden sollen online sehen können, welche Räder gerade frei sind, und sie für ein paar Stunden oder Tage reservieren können. Es soll eine Preisreduktion geben wenn man öfters Räder ausborgt. Der Verleih-Mitarbeiter soll sehen, wer was reserviert hat und wieviele Räder frei sind. Es sollte einfach und schnell zu bedienen sein, auch am Handy. Es gibt unterschiedliche Farben bei den Fahrrädern"

Class Exercise Version 2

- Your Customer wants you to develop an application
  - In general, this description is vague and incomplete

I recently saw this cool app [insert your favorite App here]. We need something similar, but better with a new cool feature

Steps

- Derive Requirements from this description
  - Do not use AI at this step
  - Describe the Requirements in your own words
  - Also think about what is missing and what would be a nice feature
- Use AI to reformulate the requirements to the ISO 29148 Standard

> Formuliere folgende informelle Anforderung als wohlformuliertes Requirement nach ISO/IEC/IEEE 29148. Achte auf: eindeutig, verifizierbar, singulär, vollständig mit Bedingungen/Schwellenwerten. Ursprüngliche Anforderung: [...]

Steps

- Compare the AI result with your own requirements
  - Try to understand why the AI version is better than the original one (or not)

- Hand in your solution on moodle
  - **Text**
  - Name of Application
  - Informal Requirements
  - AI reformulated Requirements
  - Short text about the result (evaluation of the AI result)

Creating UserInterfaces

User Interface

- Details about the UI are nonfunctional requirements, but sometimes thinking about the UI reveals that some tasks are necessary that were not considered so far.

- Path 1:
  - Try to think about how your UI should look like, try to describe these elements to a general purpose LLM
  - Look at the result, think about completeness
  - Look whether the UI fits your expectations, use LLM to make minor changes

Choose a path to create an UI

- Path 1:
  - Try to think about how your UI should look like, try to describe these elements to a general purpose LLM
  - Look at the result, think about completeness
  - Look whether the UI fits your expectations, use LLM to make minor changes

- Path 2
  - Use a dedicated UI creation tool (eg Google stich)
  - Describe what you expect or describe the functions, that should be mapped with the UI

UI Design

- Hand in your solution on moodle

Text

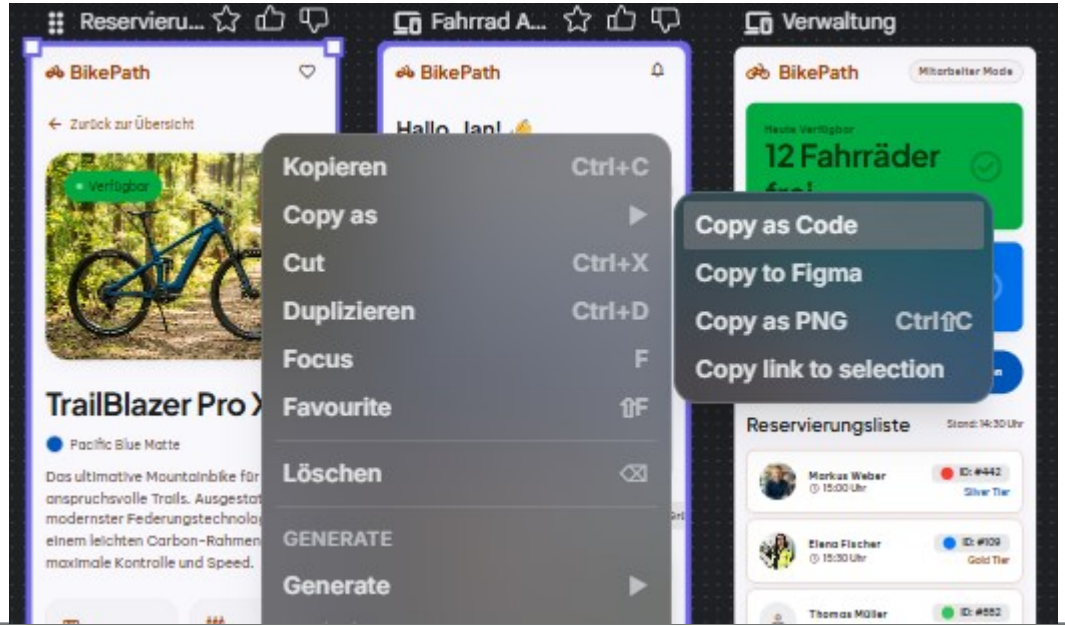

- What where your prompts
- What did you do with the result

Picture

- Make one or more screenshots of your result

What to do with the result?

- If you created a design with a general purpose LLM
  - Ask to export it in html format
- If you create a design with google stich
  - Right click on frame
  - Copy as code

What to do with the result?

- Open a simple text editor (or an IDE if already installed)
- Copy code
- Save File as „bicycle.html“
- Open saved file per doubleclick
